## 1 QUESTION-7A

- 1.1. In the given figure  $AC$  is a tangent to the circle with centre  $O$ . If  $\angle ADB = 55^\circ$ , find  $x$  and  $y$ . Give reasons for your answers.

Let the radius of the circle be ' $r$ '.  
then,

$$OB = OE = r$$

Then the length of the chord BE becomes  $2r \cos 35^\circ$ .

Applying 'cosine' rule in  $\triangle BOE$ ,

$$(BE)^2 = (OB)^2 + (OE)^2 - 2(OB)(OE)\cos(\angle BOE)$$

$$(2r \cos 35^\circ)^2 = r^2 + r^2 - 2r^2 \cos(180 - y)$$

$$4r^2 \cos^2 35^\circ = 2r^2 - 2r^2 \cos(180 - y)$$

$$2\cos^2 35^\circ = 1 - \cos(180 - y)$$

$$\cos(180 - y) = -\cos 70^\circ (\because 1 - \cos^2 \theta = \cos 2\theta)$$

$$\cos(180 - y) = \cos(180 - 70)$$

$$\therefore y = 70^\circ$$

$$\therefore x = 20^\circ (\because x = 90 - y)$$

### Solution:

Given,

$$\angle BDA = 55^\circ, \angle OCA = x^\circ, \angle AOC = y^\circ$$

As  $AC$  is a tangent to the given circle,  
 $\angle OAC = \angle BAD = 90^\circ$

Angle Sum Property for  $\triangle OAC$ ,

$$\angle OAC + \angle OCA + \angle AOC = 180^\circ$$

$$90^\circ + x^\circ + y^\circ = 180^\circ$$

$$x^\circ + y^\circ = 90^\circ$$

Angle Sum Property for  $\triangle ABD$ ,

$$\angle ABD + \angle BAD + \angle BDA = 180^\circ$$

$$\angle ABD + 90^\circ + 55^\circ = 180^\circ$$

$$\angle ABD = 35^\circ$$

$$\angle BOE + y^\circ = 180^\circ$$

$$\angle BOE = 180 - y$$
